

Domain walls and Schramm Loewner evolution in the Random Field Ising Model

Jacob Stevenson

Uni-Mainz

November, 2010, Leipzig

Outline

- 1 Motivation
- 2 Schramm Loewner evolution
 - definition
 - examples
- 3 Random field Ising model
 - Introduction
 - Ground-state computations
 - Domain walls
- 4 Evidence domain walls are SLE's
 - Fractal dimension
 - Left passage probability
 - Brownian motion

Motivation

- conformal field theory (CFT) allows for a complete classification of (pure) critical systems in two dimensions
- disordered systems, however, are not translationally (and thus conformally) invariant \rightarrow no CFT results
- Schramm Loewner evolution (SLE) describes critical curves such as domain boundaries, with implications that might go beyond CFT
- first observations of consistency with SLE in random systems:
 - 2D $\pm J$ Ising spin glass (Amoruso et al., 2006; Bernard et al., 2007)
 - 3-state random-bond Potts model (Jacobsen et al., 2009)
 - disordered SOS model (Schwarz et al., 2009)

Outline

- 1 Motivation
- 2 Schramm Loewner evolution
 - definition
 - examples
- 3 Random field Ising model
 - Introduction
 - Ground-state computations
 - Domain walls
- 4 Evidence domain walls are SLE's
 - Fractal dimension
 - Left passage probability
 - Brownian motion

Conformal invariance

Conformal map

a function $f : U \rightarrow V$ which preserves angles between curves

Riemann mapping theorem

in 2 dimensions there exists a conformal map between any two simply connected domains

Loewner evolution

- Relation between a 1D function and a curve in 2D via conformal mapping
- Curve is “extruded” into the upper half plane from the origin

Loewner evolution

- Relation between a 1D function and a curve in 2D via conformal mapping
- Curve is “extruded” into the upper half plane from the origin

animation

Schramm (stochastic) Loewner evolution

Loewner evolution

ξ_t : one dimensional
function

γ : Curve in the plane

Schramm (stochastic) Loewner evolution

Loewner evolution

ξ_t : one dimensional
function

γ : Curve in the plane

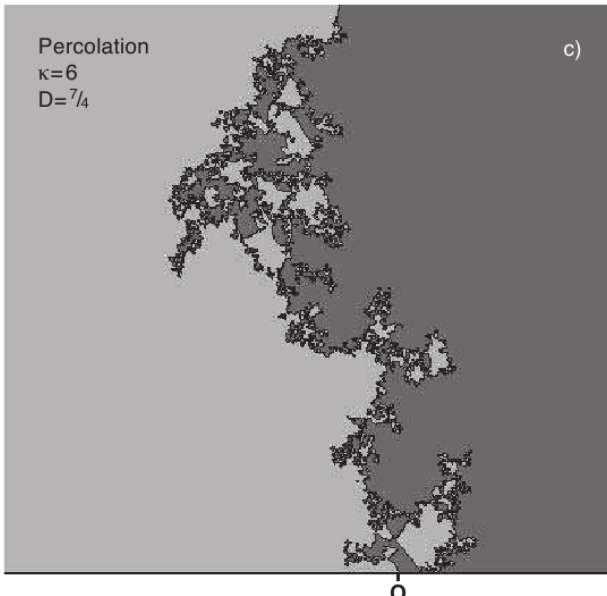

Schramm (stochastic) Loewner evolution

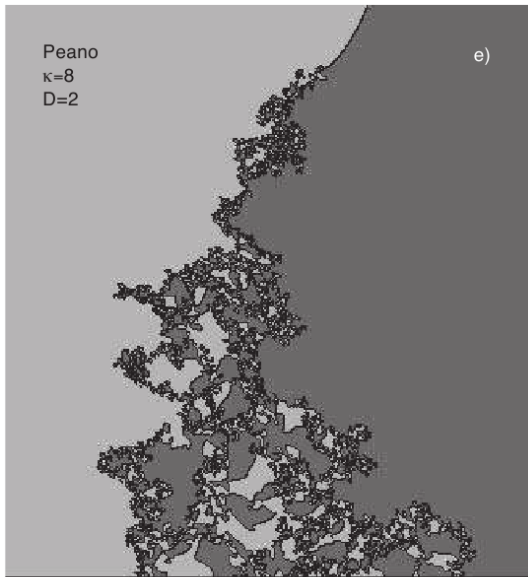

ξ_t is a Brownian
motion with diffusion
constant κ

The generated family
of curves γ is
conformally invariant
and satisfies the
domain Markov
property

Outline

- 1 Motivation
- 2 Schramm Loewner evolution
 - definition
 - examples
- 3 **Random field Ising model**
 - Introduction
 - Ground-state computations
 - Domain walls
- 4 Evidence domain walls are SLE's
 - Fractal dimension
 - Left passage probability
 - Brownian motion

Random field Ising model

$$H = -J \sum_{ij} s_i s_j - \sum_i h_i s_i$$

RFIM

- h_i : Gaussian quenched disorder
- Δ : disorder strength
- H : mean (external) field
- spin clusters grow with decreasing Δ and increasing H
- no thermodynamic transition in 2D

$\Delta = 1$

$\Delta = 2$

Ground-state computations: use graph theory

Maximum flow problem: find the minimum cut (bottlenecks)

Each link has maximum capacity c_{ij}

Statistical mechanics solution:
minimize an “energy” function

$$H = \sum_{ij} s_i(1 - s_j)c_{ij} \quad s_i \in \{0, 1\}$$

Ground-state computations: use graph theory

Maximum flow problem: find the minimum cut (bottlenecks)

Each link has maximum capacity c_{ij}

Statistical mechanics solution:
minimize an “energy” function

$$H = \sum_{ij} s_i(1 - s_j)c_{ij} \quad s_i \in \{0, 1\}$$

$$H = - \sum_{ij} c_{ij}s_i s_j + \sum_i \left(\sum_j c_{ij} \right) s_i$$

exactly analogous to the RFIM
Hamiltonian

Ground-state computations: use graph theory

Maximum flow problem: find the minimum cut (bottlenecks)

Each link has maximum capacity c_{ij}

Statistical mechanics solution:
minimize an “energy” function

$$H = \sum_{ij} s_i(1 - s_j)c_{ij} \quad s_i \in \{0, 1\}$$

$$H = - \sum_{ij} c_{ij} s_i s_j + \sum_i \left(\sum_j c_{ij} \right) s_i$$

exactly analogous to the RFIM
Hamiltonian

Graph theory algorithm

- polynomial in time
- no ambiguity about solution

Zero temperature phase diagram

Geometric critical behavior

- $H < H_c(\Delta)$: spin clusters are finite
- $H > H_c(\Delta)$: spin clusters diverge

(Seppälä and Alava, PRE 2001)

(Környei and Iglói, PRE 2007)

Ground state spin configuration

Spin cluster boundary

Outline

- 1 Motivation
- 2 Schramm Loewner evolution
 - definition
 - examples
- 3 Random field Ising model
 - Introduction
 - Ground-state computations
 - Domain walls
- 4 Evidence domain walls are SLE's
 - Fractal dimension
 - Left passage probability
 - Brownian motion

SLE numerical evidence

SLE preconditions

- 1 conformal invariance
- 2 domain Markov property

SLE numerical evidence

SLE preconditions

- 1 conformal invariance
 - transformation properties between different domains
(Környei and Iglói, PRE 2007)
- 2 domain Markov property
 - proven

SLE numerical evidence

SLE preconditions

- 1 conformal invariance
 - transformation properties between different domains
(Környei and Iglói, PRE 2007)
- 2 domain Markov property
 - proven

SLE predictions

- 1 fractal dimension
- 2 left passage probability
- 3 is the driving function Brownian motion?

fractal dimension

SLE $_{\kappa}$ prediction: $d_f = 1 + \kappa/8$

fractal dimension

SLE $_{\kappa}$ prediction: $d_f = 1 + \kappa/8$

satisfied with
 $\kappa = 6$

Schramm's left passage probability

The probability a curve passes to the left of point (x, y)

- The probability is known exactly for SLE curves in the upper half plane
- Strategy: do simulations on a finite geometry then use conformal map to test against the exact formula
- Bonus: acts as a check of conformal invariance

circle geometry

Deviation from exact formula

$$\kappa = 6$$

magnitude of deviation from schramm's formula

square geometry

Deviation from exact formula

$$\kappa = 6$$

magnitude of deviation from schramm's formula

Is the generating function Brownian motion?

- points give the distribution of the driving function after "time" t
- solid lines are Gaussian curves with variance $\kappa * t$ with $\kappa = 6$

Conclusions

Domain walls in the RFIM satisfy Schramm Loewner evolution with $\kappa = 6$

evidence

- ✓ fractal dimension
- ✓ left passage probability
- ✓ is the driving function Brownian motion?

implications

- 1 conformal invariance
- 2 other disordered systems?

Motivation
Schramm Loewner evolution
Random field Ising model
Evidence domain walls are SLE's

Fractal dimension
Left passage probability
Brownian motion

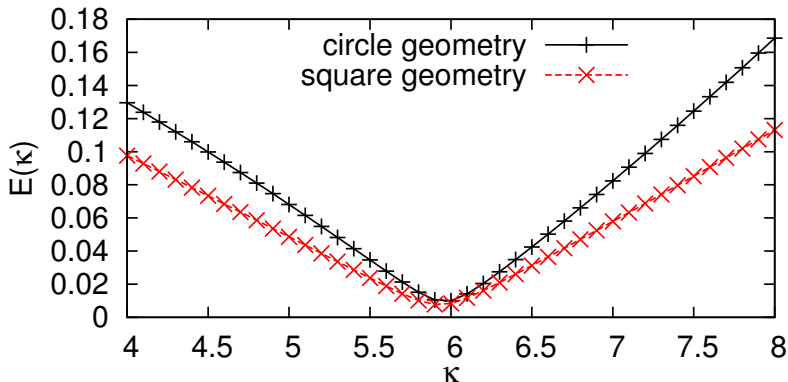

Definition: domain Markov property

Domain Markov property

Given a domain D , boundary points a and c , and b a point on the interior of the domain, then the probability of curve γ_{bc} *given* curve γ_{ab} is the same as the probability of γ_{bc} on a domain excluding the curve γ_{ab}

$$P(\gamma_{bc} \in D | \gamma_{ab}) = P(\gamma_{bc} \in (D \setminus \gamma_{ab}))$$

deviation from exact left passage as a function of κ

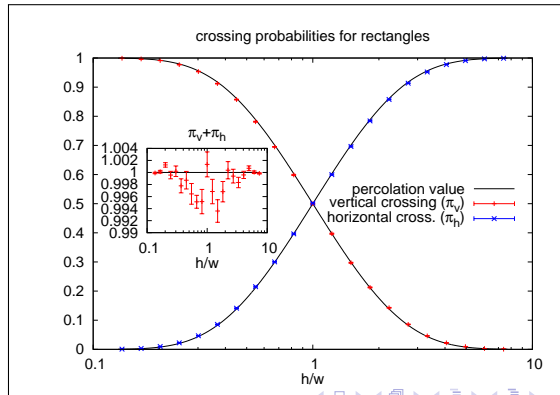

$$\text{Prob} \left[\begin{array}{c} \boxed{\text{wavy line}} \\ w \end{array} \middle| h \right] = f\left(\frac{h}{w}\right)$$

inset

symmetry
 relation

$$\pi_v + \pi_h = 1$$

inset

deviation
 from "exact"
